Introduction

Despite numerous guidelines promoting a bio-psycho-social approach in the management of patients with low back pain (LBP), many health care professionals (HCPs) still manage LBP patients mainly from a biomedical point of view. The purpose of this pilot study was to evaluate the feasibility of implementing an interactive e-learning module on the management of LBP in HCPs.

Methods

22 HCPs completed the e-learning module (see Fig. 1) and filled in a **feasibility questionnaire**. Likert Scales and qualitative open questions were both used. Before and after completing the module, participants filled in the **Back-PAQ** questionnaire to evaluate the potential **effect of the module on their attitudes and beliefs about LBP**.

Results

The module was structured and easy to complete (91%) and met the expectations of the participants (86%). Some participants (77%) identified **specific topics** that **might be discussed in more detail** in the module. HCPs knowledge, beliefs and attitudes about LBP significantly improved ($P < .001$) following module completion (see Fig. 2) with a large effect size ($ds = -1.63$).

Fig. 2 : Back-PAQ scores before and after the module

Conclusion & implications

- Implementing this e-learning module is feasible.
- This module has been effective to change knowledge and beliefs of the healthcare professionals.
- These results served to steer the intervention that is currently being examined in a larger RCT with nested process evaluation.
